

## Xbox Series X Console instructions

1. Place the console upright on the visible base on the bottom.
2. Plug the HDMI and the power cable into their respective ports in the rear of the console.
3. Turn on the Series X console by either pressing the power button located on the top left corner of the console (the Xbox logo) or by turning on one of the controllers by pressing the Xbox logo located on the top middle section of said controller. Both controllers are already paired to the system.
4. Insert a Series X disc and it should automatically install on the console's internal storage. Xbox One discs can be inserted and played on this system too. If there are discs where the case states, "Xbox Series X or Xbox One" then this system can play those as well.
5. **Under no circumstances** should anything be purchased on the console via any digital storefront nor personal accounts be logged into any video streaming service.
6. **Do not ever unplug the console while it is on**, this will damage the system. If the console freezes, hold down the main power button on the system for as long as needed until it shuts off. Wait 5 mins after it's been completely turned off before turning back on.
